DETAILED ACTION

Claim Objections

1. Claims 2-3, 5-8 and 10 are objected to because of the following informalities: In line 1 of each claim, "substrateof" should be corrected to --substrate of--. Appropriate correction is required.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 2 and 5-7 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 2 recites the limitation "the transparent area" in line 2. There is insufficient antecedent basis for this limitation in the claim.

Claim 5 recites the limitation "the first transparent area" in line 2. There is insufficient antecedent basis for this limitation in the claim.

Claim 6 recites the limitation "the second transparent area" in line 2. There is insufficient antecedent basis for this limitation in the claim.

Claim 7 recites the limitation "the second transparent area" in line 2. There is insufficient antecedent basis for this limitation in the claim.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-10 are rejected under 35 U.S.C. 102(b) as being anticipated by JP 10-206622 (JP '622). JP '622 discloses a method of manufacturing a color filter comprising the steps of forming a resin black matrix on a substrate, forming a photosensitive resin layer for a red coloring pattern, exposing the photosensitive resin layer through a photomask on which a halftone layer is arranged such that an exposure quantity in a peripheral part of the exposure pattern is less than the exposure quantity of a central part, developing the exposed photosensitive layer to form a red coloring pattern, and similarly forming a green coloring pattern and a blue coloring pattern, wherein the resulting color filter has excellent surface smoothness. See the abstracts and Figures 2A-D.

4. Claims 1-10 are rejected under 35 U.S.C. 102(b) as being anticipated by JP-2115841 (JP '841). JP '841 discloses a process for preparing a color filter comprising exposing a resist with a photomask having a light transmitting part for exposing the resist perfectly, a light shading part for prohibiting the resist from exposure, and a quasi-shading part form making the resist change from an exposed portion to an unexposed portion continuously formed on the border between the light transmitting part and the

light shielding part, such that the resulting color filter has no protrusions at the edge of a black matrix. See the abstracts and Figures 3a-b.

- 5. Claims 9-10 are rejected under 35 U.S.C. 102(b) as being anticipated by JP 2002-071928 (JP '928). JP '928 discloses a color filter comprising a resin black matrix and a coloring film overlapping the black matrix, wherein the surface of the coloring film has been polished such that the overlapping region has no protrusion and is excellently smooth. See the abstracts and Figure 1.
